THE SITUATION

FileNet users who want to view TIFF images and their annotations on the web have a problem: TIFF images are not natively supported in web browsers. In addition, for security reasons many companies have no-application-install policies. A user wanting simply to view a FileNet image may need to call the system administrator or submit a help desk ticket to install the viewer software. These delays cost productivity.

FileNet currently offers three methods to retrieve documents. The first two methods require an application download to every local machine. The Java Viewer is a 500 KB Applet download + 8MB JRE download and the IDM Viewer is 20 MB. Both are installation headaches. The 'Open' option allows you to save the image locally, but without a viewer application you will have no way to see the image.

This is the real power of **Kyte Viewer** - a TIFF image viewer with no software downloads, no hassles, no problems.

PRODUCT OVERVIEW

Kyte Viewer solves the client download problem by displaying images and annotations in a native web browser format with all of the basic viewer functionality. Annotations can also be viewed and edited and the TIFF splitting feature saves network bandwidth. There is no software to install on the client machine, no plug-ins to download.

Kyte Viewer is easy to maintain. **Kyte Viewer** is server-based and there is no client software to install, so version updates are single-sourced and everyone in your organization is on the same page at the same time. You will never again have to worry about image viewer operating system conflicts on your desktop.
